

Additional Release Notes

Color Server Pro C900

This document contains information about the Color Server Pro C900. Before using the Color Server Pro C900, make copies of these *Additional Release Notes* and distribute them to all users.

NOTE: This document uses the term “Pro C900” to refer to the Color Server Pro C900. The term “printer” is used to refer to the Printer Main Unit.

Before printing to the Pro C900:

- Verify that the correct system software version is installed on the Pro C900. For information about configuration and administration of the Pro C900, see *Configuration and Setup*.
- Install user software onto client computers. For installation instructions, see *Utilities*. For information about system requirements, see *Welcome*.

Hard disk

If the Pro C900 hard disk is full, the Pro C900 might not work normally. Back up the data and then delete some files from the hard disk.

Rush Printing

If Rush Printing is selected when a job is RIPping, the Rush Printing job will start after the RIP has finished.

Print status

If an unused paper tray is opened and closed while a job is printing, the print status might not be displayed correctly in the Activity area of Command WorkStation.

Insert Tabs and Tab Shift

In Command WorkStation, if you use the Insert Tabs feature to add tab pages to a job and you specify text to be printed on the tab, you must also select the Tab Shift option, in the Media tab in Job Properties. For more information about the Insert Tabs feature, see *Utilities*.

PowerPoint 2007

When you print from Microsoft PowerPoint 2007 and set Print What to Notes Pages, the job might take a long time to print.

Calibration

In Calibrator, if you see a message that states that you have selected a calibration set that is not associated with any output profile, you can proceed with calibration. However, the calibration data you collect will not be used to print any job unless you associate the calibration set with at least one output profile.

Each output profile in the Pro C900 is associated with one calibration set. When you print a job, an output profile (either the default output profile or one that you specify) is used to process the color data. The calibration set associated with this output profile is also used in the color processing. Therefore, if a calibration set is not associated with an output profile, the calibration set is not used.

To assign a calibration set to an output profile, use Profile Manager in ColorWise Pro Tools to set at least one output profile to the desired calibration set.

Hot Folders filters

The 1-bit TIFF filter for Hot Folders that is described in *Graphic Arts Package* is not supported.

Print Gray using Black Only (CMYK)

The Print Gray using Black Only (CMYK) print option is described incorrectly in *Color Printing*. When Print Gray using Black Only (CMYK) is enabled, any CMYK color where C=M=Y=0 and K=any value is printed using only black toner instead of processed black.
